

CSCE 312 LAB 5

By Dr. Eun Jung Kim

Announcements

- Deadline: Mar 31, 11:59 PM
- Individual Lab
- There will be no DEMO, grading will be based on the report.

SETUP for LAB5

- To setup your environment, use the **linux.cse.tamu.edu** server
- Download the simulator zip file from this [link](#).
- Binaries required for this lab are already available in “binary(only_for_linux_cse_server)” folder.
- However, we only tested these binaries in linux.cse.tamu.edu server.

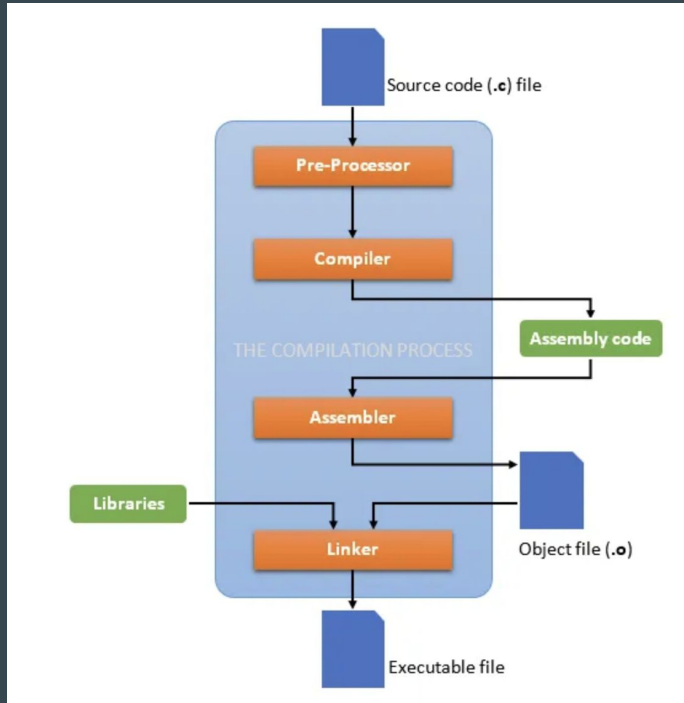

SETUP for LAB5

- To test your binaries are working properly, go to 'y86-code' folder and run following commands(Make sure both binaries are in 'y86-code' folder as well):
 - ./yas asum.y~~s~~
 - ./yis asum.y~~o~~
- The first command converts the Y86-64 assembly code (.ys) into object machine code (.yo)
- The 2nd command simulates the instructions and prints out the changes in the state of registers and memory.

```
[~]@linux2 solution]$ ./yas asum.ys
[~]@linux2 solution]$ ./yis asum.yo
Stopped in 34 steps at PC = 0x13. Status 'HLT', CC Z=1 S=0 O=0
Changes to registers:
%rax: 0x0000000000000000      0x0000abcdabcdabcd
%rsp: 0x0000000000000000      0x0000000000000200
%rdi: 0x0000000000000000      0x0000000000000038
%r8:  0x0000000000000000      0x0000000000000008
%r9:  0x0000000000000000      0x0000000000000001
%r10: 0x0000000000000000      0x0000a000a000a000

Changes to memory:
0x01f0: 0x0000000000000000      0x0000000000000055
0x01f8: 0x0000000000000000      0x0000000000000013
```

Steps in Program Execution

- Pre processing: gets rid of comments, replaces macros, includes header files
- Compiler: Parses through the code and converts the high level code to an Intermediate Representation [Assembly Code]
- Assembler: Takes this Assembly code and converts it into binary
- Linker: links multiple such binaries so that functions from other binaries can be used and finally an executable file is created

Y86-64 [Assembly Code]

- Instruction Set Architecture similar and much simpler form of x86
- PROGRAM COUNTER – indicates address of current instruction that is being implemented
- REGISTERS - 64bit meaning each register is of length 64bits
- MEMORY (DRAM) – Each address corresponds to 64bit
- CONDITION FLAGS – 1 bit flags set by arithmetic and logical operations
 - OF : Overflow
 - ZF : Zero
 - SF : Negative
- STATUS REGISTER - indicates state of current execution
 - AOK : Normal Operation
 - HLT : Program halted
 - INS : Invalid instruction encountered
 - ADR : Bad address encountered

REGISTERS

- Each register has 4-bit ID

<code>%rax</code>	0	<code>%r8</code>	8
<code>%rcx</code>	1	<code>%r9</code>	9
<code>%rdx</code>	2	<code>%r10</code>	A
<code>%rbx</code>	3	<code>%r11</code>	B
<code>%rsp</code>	4	<code>%r12</code>	C
<code>%rbp</code>	5	<code>%r13</code>	D
<code>%rsi</code>	6	<code>%r14</code>	E
<code>%rdi</code>	7		F

Y86-64 Instruction Set - Operations

<code>addq rA, rB</code>
<code>subq rA, rB</code>
<code>andq rA, rB</code>
<code>xorq rA, rB</code>

Let `rdx = 5`, `rax = 2`

- `addq rA rB` - add two register value ($\text{Reg}[\text{rB}] = \text{Reg}[\text{rB}] + \text{Reg}[\text{rA}]$)
 - `addq %rdx, %rax`
 - result : `rax : 7`, `rdx : 5`
- `subq rA rB` - subtract two register value ($\text{Reg}[\text{rB}] = \text{Reg}[\text{rB}] - \text{Reg}[\text{rA}]$)
 - `subq %rax, %rdx`
 - result : `rdx : 3`, `rax : 2`

Let `rdx = 6 (110)`, `rax = 4 (100)`

- `andq rA rB` - bitwise and operation, $\text{Reg}[\text{rB}] = \text{Reg}[\text{rB}] \& \text{Reg}[\text{rA}]$
 - `andq %rdx, %rax`
 - Result : `rax : 4`, `rdx : 6`
- `xorq rA rB`: bitwise exclusive-or operation, $\text{Reg}[\text{rB}] = \text{Reg}[\text{rB}] \wedge \text{Reg}[\text{rA}]$
 - `xorq %rdx, %rax`
 - result : `rax : 2`, `rdx : 6`

Y86-64 Instruction Set - Jump

<code>jmp L</code>
<code>jle L</code>
<code>jl L</code>
<code>je L</code>
<code>jne L</code>
<code>jge L</code>
<code>jg L</code>

- `jmp` - jump to that destination
- `jle` - if less or equal , jump to Dest if last result ≤ 0
- `jl` - if less, jump to Dest if last result < 0
- `je` - if equal, jump to Dest if last result $= 0$
- `jne` - if not equal, jump to Dest if last result $\neq 0$
- `jge` - if greater or equal, jump to Dest if last result ≥ 0
- `jg` - if greater, jump to Dest if last result > 0

Y86-64 Mov Instructions

Instruction	Source	Destination
<code>rrmovq rA, rB</code>	Register	Register
<code>irmovq V, rB</code>	Immediate	Register
<code>rmmovq rA, D(rB)</code>	Register	Memory
<code>mrmovq D(rA), rB</code>	Memory	Register

- `irmovq` : immediate value (number) into register
 - `irmovq $3, %rax` , will store value 3 to the rax register
- `rrmovq` : move one register value to another
 - `rrmovq %rax, %rcx` , now rcx has value 3
- `rmmovq` : move register value to memory
 - `rmmovq %rax, 0(%rbx)` ; assume ebx : 0x4000, now at address 0x4000, it contains 3
 - `rmmovq %rax, 4(%rbx)` ; number in front : offset, add 4 to that memory address, 0x4004 contains 3
- `mrmovq` : move value from memory to a register
 - `mrmovq 4(%rbx), %rdx`; move value at 0x4004 into rdx, which is 3 now.

Other Instructions

We have other instructions as well such as:

- Push
- Pop
- Call
- Ret

More details:

https://csit.kutztown.edu/~schwesin/fall21/csc235/lectures/Instruction_Set_Architecture.pdf

PROBLEM 1, 2

- Write the correct y86-64 assembly code in .ys files for the C code given in the question
- Generate .yo files from .ys files:
 - > ./yas <filename>.ys
- Execute the code from the .yo file:
 - > ./yis <filename>.yo
- After successful execution it shows you the changes in registers and memory.
- Helpful Resource:
 - Bryant Book 3.1 - 3.6
 - Codes in y86-64 folder

```
int i,j;  
....  
if (i < j) {  
    i=i-3;  
    j=j+4;  
}  
else {  
    i=7;  
    j++;  
}
```

Problem 1

```
int j,k;  
....  
for (int i=1; i <=10; i++) {  
    j = i*2;  
    k = j-4;  
}
```

Problem 2

PROBLEM 3

- Generate x86 assembly code in .s files from the C code given to you and analyze the assembly code as instructed in the questions
 - > gcc -S <filename>.c -o <filename>.s
 - .s file has the assembly code
- Helpful Resource:
 - <https://medium.com/@laura.derohan/compiling-c-files-with-gcc-step-by-step-8e78318052>

```
//Program 1, file name "lab5_prob3_1.c"
#include <stdio.h>
int main(int argc, char *argv[]){
    printf("Hello, world\n");
    return 0;
}

//Program 2, file name "lab5_prob3_2.c"
#include <stdio.h>
int main(int argc, char *argv[]) {
    int i = 2;
    i++;
    printf("The value of i is %d\n", i);
    return 0;
}
```

PROBLEM 4

- Generate x86 assembly code in .s files from the C code given to you and analyze the assembly code as instructed in the questions

```
//File 1, named "lab5_prob4_main.c"
#include <stdio.h>
void print_hello();
int main(int argc, char *argv[])
{
    print_hello();
    return 0;
}

void print_hello(){
    printf("Hello, world\n");
};
```

PROBLEM 5

- Generate assembly and object files from the given C code. Then link those object files to get the executable. Finally, analyze the assembly code as instructed in the questions.

```
//File 1, named "lab5_prob5_main.c"
void print_hello();
int main(int argc, char *argv[]) {
    print_hello();
    return 0;
}

//File 2, named "lab5_prob5_print.c"
#include <stdio.h>
void print_hello() {
    printf("Hello, world\n");
};
```

PROBLEM 6

- Use inline x86 assembly to add assembly code to a C program.
- How to do that?
 - [Resource 1](#)
 - [Resource 2](#)
 - [Resource 3](#)
 - [Resource 4](#)

```
//File named "lab5_prob6.c"
#include <stdio.h>
int very_fast_function(int i){
    if ( (i*18 - 3) <= 300) return i++;
    else return 0;
}

int main(int argc, char *argv[]) {
    int i;
    i=16;
    printf("The function value of i is %d\n",
        very_fast_function(i) );
    return 0;
}
```

Files to be submitted as a zip file

- Report with all screenshots
- yas executable
- yis executable
- .yo and .ys files for Problem 1 and Problem 2
- .s files for Problem 3,4,5
- .c file for Problem 6
